Congratulations to Bishop Chemistry Students Monica Chan and Kristen Hazelton whose work on the new periodic table of moles will be published this winter by the American Chemical Society. Monica’s work on Argon and Kristen’s work on Californium was chosen from a national pool of submissions.

Here’s a sampling of what is going on in classrooms:

**Spanish II** will be retelling stories, fairy tales and Disney classics in order to learn the past tense. Students in **English 9** are working on 5 - 6 page research papers identifying a problem or conflict in the world and detailing its causes. **Theology 10** students are learning about various martyrs in the history of the Catholic Church in anticipation of a research project on a particular martyr. **Astronomy** class will be studying planetary geology and the effects of gravity on the formation of the solar system.
