Sadly, vaping is all the rage especially with teens. It’s reported fewer teenagers are smoking traditional cigarettes, and choosing to vape. One in four high school students are vaping with products such as e-cigarettes, e-cigars, vape pens, or Juuls.

Most teenagers will say the flavors make this new habit appealing. The commercials and radio ads describe the tasty flavors of Murica/Rocket Popsicle Flavor, Smurf Cake/Blueberry Cheesecake Flavor, Rainbow Crunch/Fruit Cereal Flavor and Circus Bear/Strawberry Banana Custard Flavor are delicious to young teenagers and with less calories then if they enjoyed a slice of blueberry cheesecake.

Parents have heard their child talk about it or have admitted to trying it. After all, according to many teens, “It doesn’t contain any nicotine at all so it’s completely safe.”

**WARNING: Within Weeks of Vaping, Teen Develops Horrifying "Wet Lung**

Vapes, also known as an e-cigarette, are a popular alternative to smoking as many believe them to be less harmful. Vaping is popular with younger people and those trying to quit smoking cigarettes. But as one 18-year-old woman found out, vaping can still cause serious health issues.
A teenage girl working as a restaurant hostess began using e-cigarettes, but within just three weeks, she had developed a terrifying medical condition called wet lung.

She noticed symptoms like excessive coughing, severe pain in her chest, and being short of breath, so she went to the emergency room. By the time doctors got a look at her, she was deteriorating rapidly and doctors were baffled.

The scared young woman was administered antibiotics but this was not enough, and she then went into acute respiratory failure. Just to keep her breathing, she was put into a ventilator machine with tubes sticking out of her chest to drain the liquid from her lungs.

She was unable to get enough oxygen into her blood from her lungs and required a mechanical ventilator to breath from her until her lungs recovered.

Doctors then figured out that she had a condition called wet lung, which is the term for sensitivity to pneumonitis triggered by ingredients in an e-cigarette. She stayed in the machine while her lungs recovered and was given a drug used for severe allergic reaction. Within days, she had made a significant recovery and her terrifying ordeal was over.

Vaping may also cause a horrifying condition called popcorn lung, caused by breathing in a chemical called diacetyl. Popcorn lung is found in some flavorings used in e-cigarettes and the condition causes coughing and wheezing. Before vaping, consider the serious health problems that can occur!
